ONE LEARNER. ONE TOWN. DECISIONS THAT STAY WITH YOU.

LIFEOF₹

Mina wants to save his festival money for a reading lamp. A visit to the bank begins a journey through an illustrated Indian town, where each choice has a consequence and each lesson follows his home.

01 / THE WORLD A frame from the running game: travel through a town built around places where money decisions happen.

Why this game exists

A student may recognise “UPI” or “EMI” and still be unsure what to do at a counter, on a payment screen, or after a worrying message. Lifeof₹ lets Grade 11–12 learners practise those moments safely. Every identity, balance, and transaction is fictional.

What the final build delivers

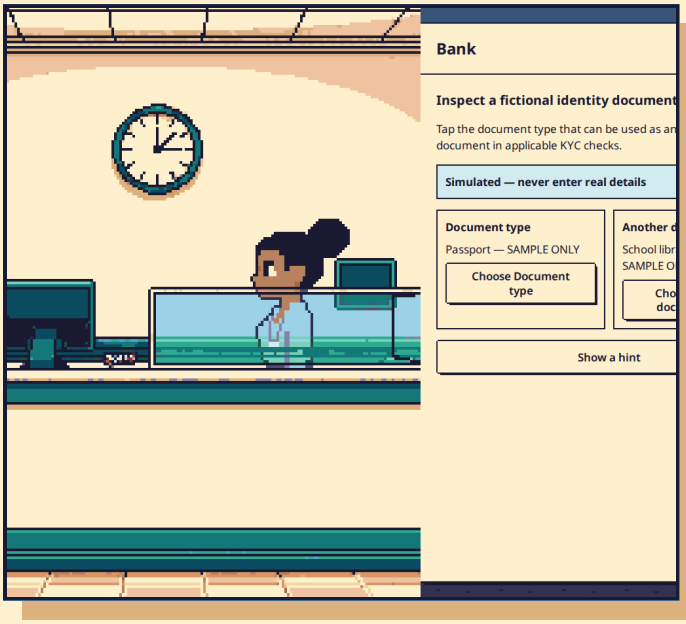

We built twelve authored missions, from budgeting and banking through UPI safety, borrowing, insurance, investing, and a final connected month. Learners inspect, compare, and decide; specific feedback, replay, a skill tree, and changing places carry their progress forward.

EXPLORE → DECIDE → SEE CONSEQUENCE → TRY AGAIN

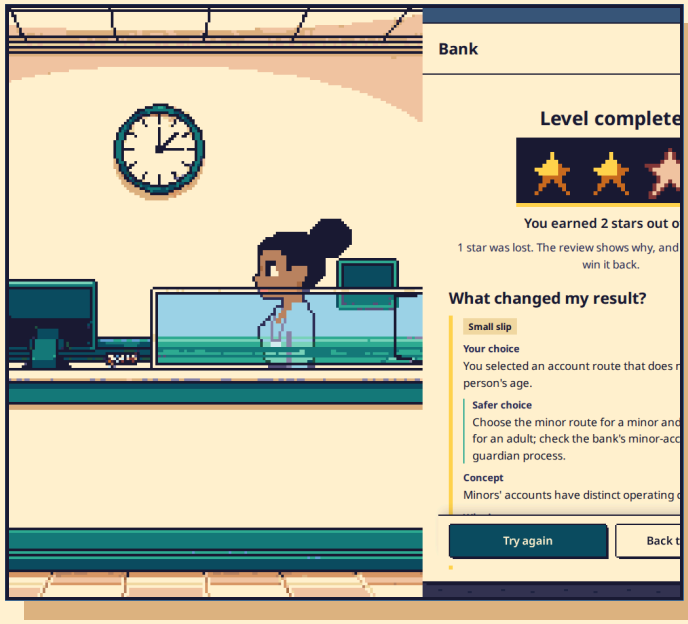

THE STORY BEGINS WITH A QUESTION, NOT A QUIZ.

MINA IS A MINOR. WHICH ACCOUNT FITS?

At the bank, Mina wants to save his festival money. The player inspects sample documents and chooses an account route. Pick the adult route and the game explains why the minor route is safer, then gives a new case to apply the lesson. No real document or account detail is entered.

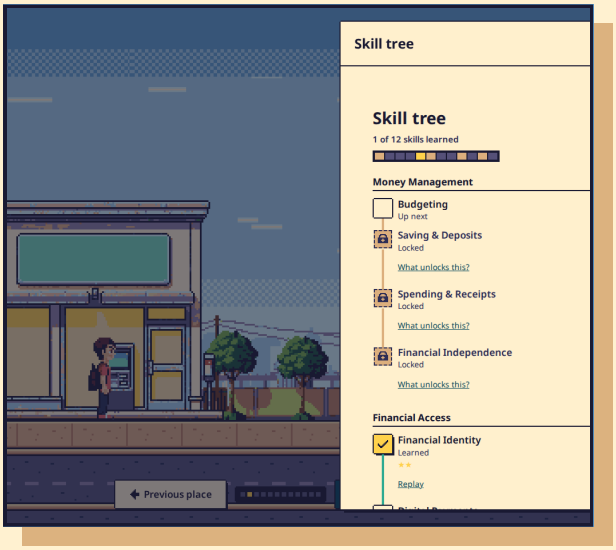

02 / ACT Inspect a sample document and choose a route in the bank.

03 / REFLECT A two-star mistake is explained, not erased; replay can improve the best score.

> **How this grew:** M1 set out to prove one complete bank journey. We made that journey playable, then connected UPI, fraud, and loans, then built the remaining eight missions. Reusable interactions, original pixel art, and deterministic rules let the same town hold a full curriculum instead of twelve disconnected quizzes.

04 / REMEMBER Learning stays visible in the skill tree and on return visits.

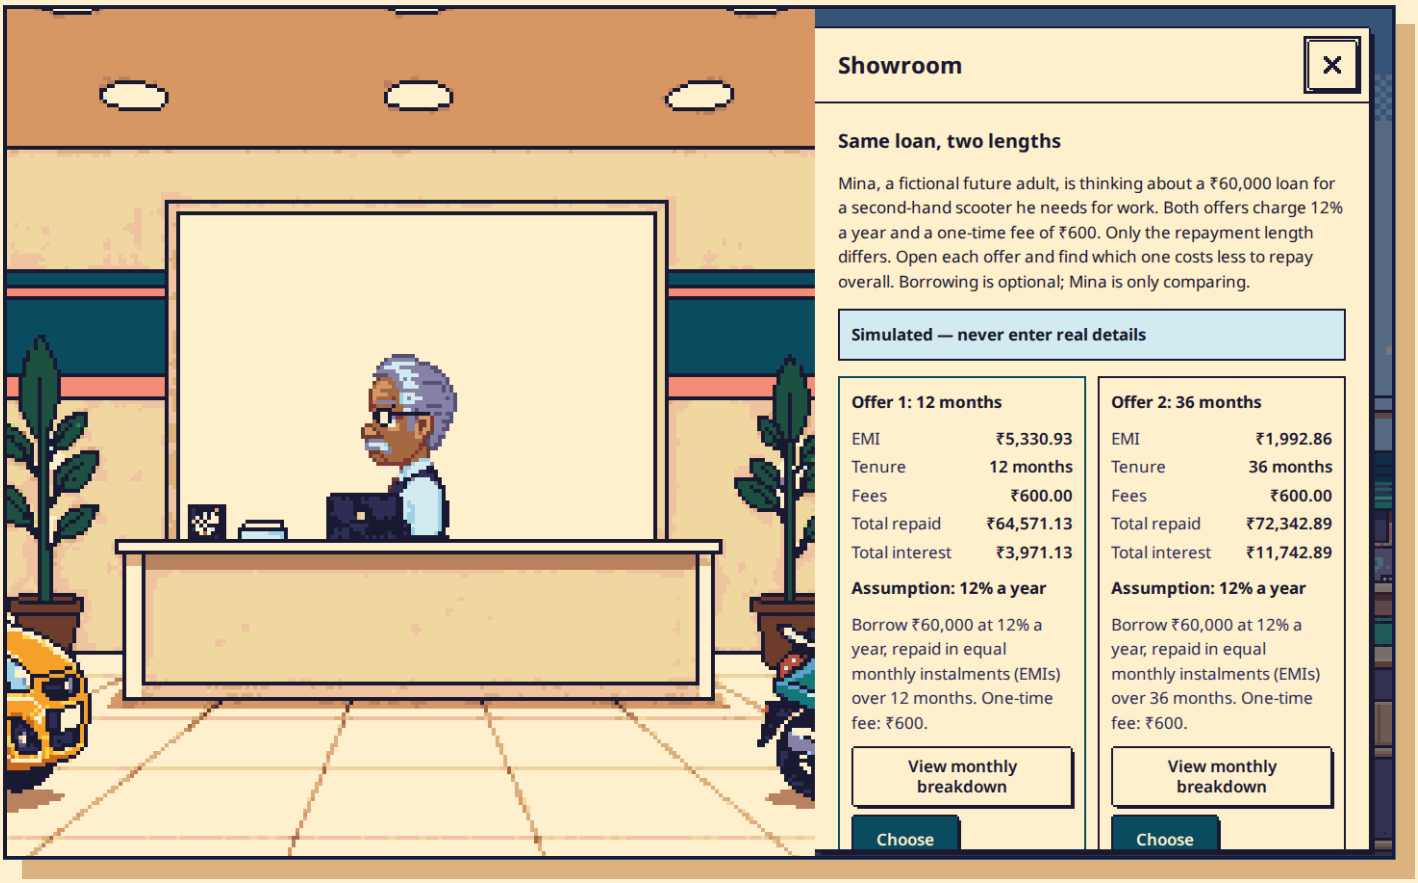

The town remembers what happened

1. After the bank, the teller recognises Mina; saving for the lamp changes his home.
2. At the phone shop, he learns to notice a message that demands a hurried response. That same pressure cue can return in a later easy-loan ad.
3. Attempts, skills, and world changes come from recorded choices. Replay improves a best score without deleting the first try.
4. Progress stays on the device and can resume after a break. English and Telugu text, keyboard controls, and reduced motion make the journey easier to enter.

A LATER CHAPTER TESTS WHAT MINA CARRIES WITH HIM.

A SMALLER EMI. A LONGER PROMISE.

In a fictional future-adult case, Mina compares two ₹60,000 loans at 12% a year plus a ₹600 fee. Paying over 36 months feels easier each month, yet raises total repayment from ₹64,571.13 to ₹72,342.89. The player must check both the whole cost and what remains after essentials; postponing is a valid choice when neither offer fits.

05 / TRANSFER A real game frame. The figures come from the finance rules; these fictional offers are not product advice.

12 authored levels integrated	**580** unit/component tests passing	**107** approved art assets linted	**2** languages: English and Telugu

Evidence of a working build

The final checkout passed TypeScript, ESLint, content lint, asset lint, a production build, and 580 unit/component tests. Browser journeys exercise phone and desktop sizes, accessibility, offline play, and same-origin requests; the full browser suite still needs a clean pass after transition-case failures. All five images are from the running game.

Designed for trust

The game needs no real names, account identifiers, PINs, OTPs, or payments, and core play needs no backend or model. Scores reward reasoning and improvement, never speed or wealth. Financial claims link to Indian public sources. Newer lessons still need final educator sign-off; a classroom pilot and measured learning outcomes are future work.
