PAISA STREET / BUILD PROGRESS

A town you can learn from.

A financial literacy game where a learner travels through an Indian street, makes a consequential choice, sees why it matters, and returns to try again.

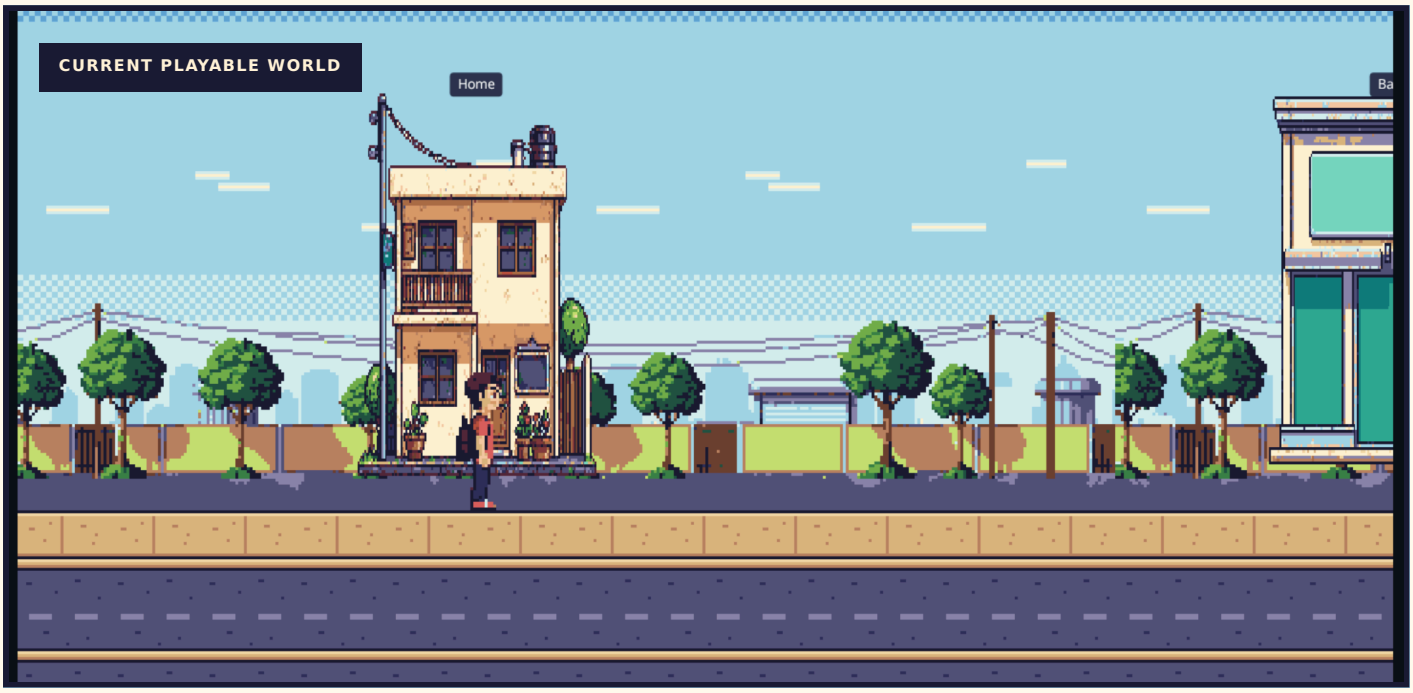

Fig 01. Integrated pixel-art street from the current build. Uploaded D2 capture

FROM M1 PLAN TO M2 IMPLEMENTATION

01 / PLACE

The town is playable

Pixi renders approved street art; swipe, wheel, keyboard and buttons move one location at a time. React labels and panels stay readable above the scene.

02 / DECISION

The bank journey runs

Level 2 pairs fictional forms and document inspection with a scored result. Attempts persist locally; completion can change the bank teller visual.

03 / MEMORY

Rules survive a reload

Typed lesson events feed deterministic scoring and state. Integer-paise finance and validated IndexedDB saves keep progress reproducible.

INPUT **Street + HTML panels** → LEARNING **Lesson events + rubric** → STATE **Saved attempts** → FEEDBACK **Stars + town change**

Scope at M2. Banking is the registered live lesson. UPI, fraud and borrowing lesson definitions are authored in the repository; their full player-facing interactions are still to be integrated.

EXPERIMENT LOG / DELIVERY PATH

Measured progress. Clear next steps.

The first slice now has a working path through travel, lesson, result and persistence. The report distinguishes shipped behavior from authored content and planned validation.

Experiments & results

Checks run against this repository at M2, including the current art integration.

21/21 — **Browser checks passed**
Across 360×740, 412×915 and 1440×900: one-stop travel, bank fixture completion, teller change, reload, panel scroll, load budget and same-origin smoke.

360/360 — **Full unit/component run passed**
All 43 files passed, including English and Telugu gallery axe checks, after allowing their full-screen sweep a 20 s test budget.

49/49 — **Asset lint passed**
Content lint, TypeScript checks, ESLint and production build also passed. The built main entry is 191.91 KB gzip.

What these results establish: a reproducible playable bank slice and integrated art. They do not yet establish learning outcomes, a complete four-lesson journey or real-device performance.

Remaining time

Finish the smallest credible demo, then confirm the release gates.

01 **Complete the learning loop.**
Add the exact 2-star mistake → 3-star retry browser path, first-attempt preservation and skill-tree check using the real Level 2.

02 **Wire the authored P1 lessons.**
Integrate UPI, fraud and loan interactions; verify the negative borrowing consequence and earlier-choice callback.

03 **Close the evidence gaps.**
Test offline reload, reduced motion, Telugu overflow, mobile performance and a real Android device. Obtain educator review of financial claims.

Evidence: repository tests and build run at M2; uploaded D2 captures; official Megathon X submission deliverables §§1, 3. Browser checks use a bank fixture for the full journey; live lesson coverage is narrower. All scenarios and identities shown are fictional.
